

Asset Disposition Decision Workflow

Helix Workflow+ supports asset disposition within your existing workflow. The process often begins with a fair market value (FMV) report when an asset is identified for replacement. This report helps determine the best disposition method(s) available.

What is my equipment worth?

FMV Report

Fair market value reports are available from your dashboard in Workflow+. These reports compare actual resale values for similar assets, and are the first step to determine ideal disposition method(s).

Do you have a fair trade-in offer?

To avoid leaving money on the table, all trade-in offers should be validated against the asset's current fair market value.

if not

Can another in-network facility use the asset?

For members within a defined network, reallocating the asset to another facility helps retain value within the system.

if not

Is the asset worth significant value?

High-value assets can be listed and sold to another medical facility. Low-value assets must be grouped into bulk lots for removal.

if not

Internal Transfer

With a system tailored to your network, Workflow+ makes asset reallocation between facilities simple.

Approved users can list transfer items, then track and approve offers within the system.

Hospital Exchange

The Exchange is a resale platform exclusively for medical facilities and health systems.

Leveraging this platform helps maximize value recovered, especially since many registered buyers are end users.

Bulk Disposition

Low-value assets must be grouped to have enough value for pick-up and/or resale.

BidMed can help identify when sufficient low-value assets have accumulated in order to list, sell, and remove as a lot.
